Abstract- *As a sub-discipline of geography, medical geography studies the environment and health-related lifestyle, relationships between lifestyle and health, disparities in the distribution of health infrastructure. Medical Geographers should take an oath to answer questions about which, where and where and who gets the proper care and proper care. The attempt to ask such questions is said to have started in 400 BC. The medical geography by Hippocrates involves two major components, e.g.: Geography of the health and health service of the disease; In both cases, health related discussions may be from local point of view, they have certain differences; In recent years, ICT has been received with sub-disciplined state-of-the-art mapping technology and statistical packages. The quality of the map, as a cartographic product, has been multiplied; therefore, it revives the notion of 'It cannot be mapped if it is not geography'. However, the main purpose of this paper is to visit the place of medical geography from its origin.*

Introduction

Medical geography, sometimes called health geography, is a field of medical research that covers geographic techniques in spreading health studies and spreading disease worldwide. In addition, there is an impact on weather and location on the delivery of health and health services of a person in a medical geographical direction. Medical Geography is an important area because its purpose is to understand health issues and to have an impact on the health of people who influence various geographical factors.

A hybrid health research in geographical and medicines related to geographical areas of health and healthcare is a "new" area. Medical Geography Studies the health and locale impact on health. It is to improve the understanding of various factors affecting the health of the population and therefore to target individuals. This is also called health geography.

Discussion on important topics related to medical geography is to 'critically evaluate the social and regulatory health of the disease and health'. Mapping of local issues and health issues. Medical Geography has developed as a sub-discipline of geography that studies the topics related to environment and health, lifestyle and health, disparity in the distribution of health infrastructure, and issues related to local problems. JACUS MJ has summarized Sabadh in his words- "Today we realize that this disease is one such event that happens only when the various components match in time and in space. The scope of interest to incorporate the relationship between various components of this complex and related geographic ecosystem is widespread. This can be called "medical geography". In brief, medical geography is a promising area of research to analyse geological patterns of health and disease, including environmental and social relations. In addition, it shows the location of
